GET ANSWERS TO YOUR QUESTIONS ABOUT THE COVID-19 VACCINE

Why should I get the COVID-19 vaccine?

COVID-19 can cause serious illness. All COVID-19 vaccines now available in the United States have been shown to be highly effective at preventing COVID-19 disease.

Is it safe to get the COVID-19 vaccine if I have a medical condition?

Yes, it's especially important for people with conditions like heart disease, lung disease, diabetes or obesity to get the vaccine as soon as they can. People with these conditions are more likely to get very sick from COVID-19. People with autoimmune conditions or weakened immune systems due to other illnesses or medication may receive the vaccine but should consult with their doctor first.

Can COVID-19 vaccines cause infertility or other serious medical problems?

No serious safety concerns have resulted from testing or real-world use of any of the COVID-19 vaccines.

Are the vaccines safe?

Safety has been a top priority throughout the vaccine development and approval process. No serious safety concerns emerged during the clinical trials for the three authorized vaccines.

Should I get vaccinated if I have already had COVID-19?

Yes. At this time, experts do not know how long someone is protected from getting sick again after recovering from COVID-19. Because of the severe health risks associated with COVID-19, you should get vaccinated regardless of whether you've already had COVID-19.

Will the vaccine protect me against the new Delta strain and other variants?

Currently available vaccines in the United States are effective against COVID-19 variants, including Delta.
